

5 **Abstract**

 A system and method for actuating a moveable barrier operating system. A wireless time
signal at a receiver. A time-of-day signal is supplied at the output of the receiver. The receiver is
automatically reset using the wireless time signal when the time-of-day signal is different than the
time represented by the wireless time signal. A moveable barrier is actuated using the time-of-day
10 signal at the output of the receiver.
